Category:Apple Inc. Category:Unix history Category:Unix-like operating systems Category:MacOS Category:PowerPC-only Unixes Category:NeXTstep1. Field of the Invention This invention relates to a tire having an annular carcass reinforcement and a crown reinforcement, the ends of which are anchored in bead cores by at least one anchorage band. 2. Description of the Related Art The invention relates more particularly to the tires for vehicle wheels, and the invention relates more particularly to the type of tires generally designated as "tubeless tires". In the case of "tubeless tires", the bead cores that serve to anchor the ends of the crown reinforcement and of the annular carcass reinforcement in the beads of the tires and whose purpose is to come to rest against the inner surface of the rim are for the most part surmounted radially outward by one or more anchorage elements that serve to anchor the ends of the crown reinforcement and of the carcass reinforcement, the latter ends then being anchored in the bead cores. In order to be mounted on a rim, the end of the carcass reinforcement is generally preceded by a radial bead filler band whose purpose is to come to rest against the inner wall of the rim. In the case of tires of the "tubeless" type, the annular anchorage band may also be called the "bead filler" or the "bead fillers". The invention relates more particularly to the case of the tires described in Patent FR 2 692 627. According to that patent, the annular carcass reinforcement is generally formed of a single ply of elastomeric material. However, it may also be formed of at least two plies of reinforcing cords. It includes a first ply, referred to as a working ply, and a second ply, referred to as a protection ply. The first ply forms at least a part of the bead cores and is generally formed of at least one metallic reinforcing element surrounded by at least one layer of elastomeric material. The second ply, which is generally formed of at least two plies of reinforcing elements, is arranged radially outwardly of the first ply and of the carcass reinforcement and is generally formed of metallic reinforcing elements that are covered at least in part by at least one layer of elastomeric material. Typically, the anchorage band or bands, which are disposed radially
